E.	Definition of Conservation Easement
F.	Model Deed with Minimum Water Supply Protection Restrictions
G.	Memorandum of Agreement with NH DOT and Map of Eligible Area

A. INTRODUCTION

New Hampshire's population increased by 6.5 percent between 2000 and 2010, the fifth straight decade in which it has grown at a rate faster than any other state in the Northeast.¹ It will likely continue to be the fastest growing state in the Northeast, presenting a challenge to municipalities responsible for supplying high quality, safe drinking water to their residents. The challenge is to maintain high-quality water supply sources in a changing landscape. Industrial, commercial, and residential development all have the potential to degrade drinking water quality. Rainwater flows across roadways, driveways, roof tops, lawns, and parking lots, gathering contaminants such as motor oil, gasoline, pesticides, fertilizers, and road salt before the water infiltrates into the ground or flows into surface water. In contrast, a natural landscape, particularly when forested, filters and slows down water before it reaches surface water and groundwater. Forests not only filter water but release it more gradually than developed surfaces, so that forested land surrounding a drinking water source preserves not only the quality of the water, but quantity as well. Resource managers increasingly refer to phenomena such as this as "ecosystem services" or "watershed services," referring to the fact that the natural environment provides economically valuable services that would otherwise cost money to provide.²

Figure 1 below shows the relationship between sources of contamination and groundwater sources of drinking water.

Figure 1

Keeping water supply lands in an undeveloped state is an integral part of water supply protection. The multiple-barrier approach to water supply protection, adopted by the U.S. Environmental Protection Agency and the water supply industry, encompasses a range of strategies, from selecting the best available water sources and protecting them from contamination, to measures that focus on the treatment, monitoring, and distribution of water. Under this framework, these multiple barriers work together to help ensure a safe supply of drinking water. No single aspect of water supply management, such as treatment, should be relied upon to the exclusion of other elements such as source protection. However, as new contaminants are discovered, new and more elaborate treatment techniques are required. While advances in technology allow us to treat for more contaminants than ever before, these treatments are not necessarily a cheap fix. Costs are highly variable depending on the treatment techniques being used by a water system.

A 2008 study by the U.S. Environmental Protection Agency, U.S. Department of Agriculture, Forest Service (USFS), and Trust for Public Land (TPL) linked declining forest cover in water supply watersheds with lower water quality and increased water treatment costs. Among the various measures of land cover, such as forest cover or urban cover in the entire watershed, forest cover within a 100-foot buffer around water bodies showed the strongest correlation with a water quality index comprising total organic carbon, turbidity and alkalinity. The study was based on a survey of 60 water treatment plants across the country treating between 1 million and 100 million gallons per day.³

A 2005 report by the U.S. Geological Survey, with support from the N.H. Department of Environmental Services (DES), showed that when impervious surfaces increased in a corridor around a stream, turbidity also increased. Urban land use within a one-kilometer radius or a 25-meter stream buffer upstream of a sampling site showed the greatest correlation to high turbidity levels.⁴ Sample sites that were surrounded by forested areas had lower turbidity levels. Studies have shown that processes such as flocculation (where chemicals are mixed into the water to cause particles to clump together into larger and more easily removable clots, or “flocs.”) and filtration can often be omitted in water supplies with high forest land cover.

Water suppliers have practiced source water protection for centuries, if not longer. As early as 1610, the Governor of Virginia issued a proclamation prohibiting various activities within ¼ mile of the fort at Jamestown in order to protect the settlement’s water supply wells.⁵ Today, source water protection strategies range from land conservation to zoning-based restrictions on land use to programs that seek to ensure the implementation of best management practices where hazardous substances are used.

Some communities, typically larger cities with old water systems, have long practiced source water protection by purchasing land around their drinking water intakes; this has been most often used in protecting surface water supplies rather than wells. For example, Manchester Water Works has used Lake Massabesic as its water supply source since 1874 and now owns 8,000 acres of land, including 95% of the Lake’s 28-mile shoreline.⁶ The City of New York, which has drawn its water supply from watersheds at least 40 to 100 miles away since 1842, committed \$250 million for land conservation over a recent ten-year period.⁷ The Commonwealth of Massachusetts owns or controls nearly 29,000 acres (57%) of the vast Quabbin Reservoir watershed, which came on line as a water supply source for metropolitan Boston in 1948.⁸

Purchasing land or placing conservation easements on critical water supply land, over which water flows towards surface water and groundwater drinking water sources, is by far the most effective way to protect drinking water by preserving forested buffers. A conservation easement is a legally binding agreement that limits certain types of activities and development from taking place on the land. (A more detailed definition of a conservation easement can be found in Appendix E and model conservation easements can be found in Appendices F and G). A 2002 study by TPL and the American Water Works Association looked at 27 surface water supplies and found that for every 10 percent increase in forest cover in the drinking water source area, treatment and chemical costs decreased approximately 20 percent.⁹

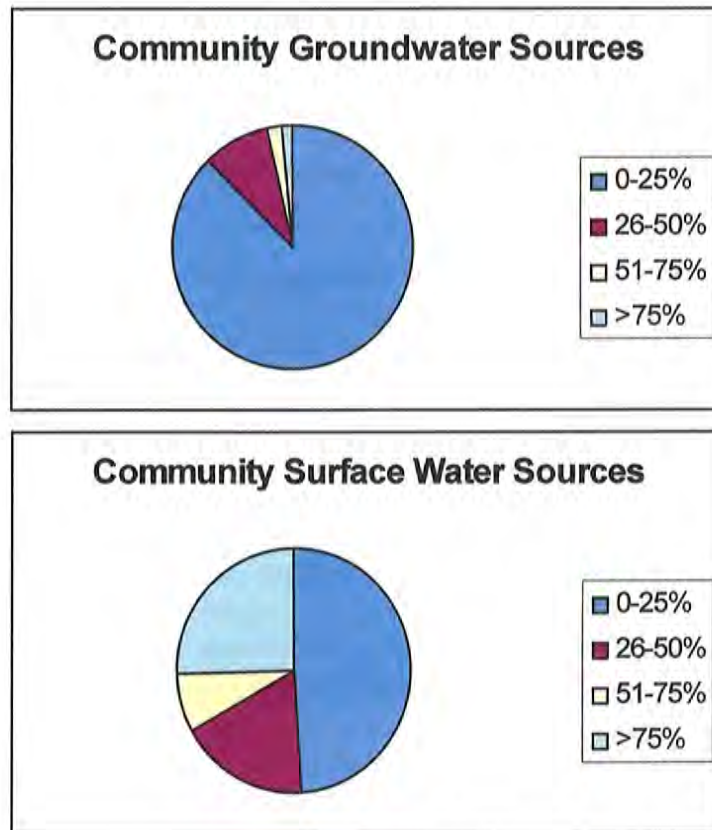

Despite the importance of protecting natural forest land buffers, a 1998 study prepared by the Society for the Protection of N.H. Forests (SPNHF) for the N.H. Department of Environmental Services (DES) found that in N.H., only 11 percent of the lands through which water flows to sources of public drinking water supplies were protected via ownership or conservation easement.¹⁰ The study also reported that 39 percent of community water systems did not even own the sanitary protective radius (150 - 400 feet) around their wells.¹¹

Manchester Water Works is not alone in having the foresight to protect its water supply watershed lands; many water systems in N.H. benefit from locating their sources in areas protected by the municipality (as in Concord, Gorham, and Hancock, to name a few), the state (Pembroke), the White Mountain National Forest (Bartlett, Berlin, Bethlehem, Jackson, Lancaster, Lincoln, and Littleton), and non-profit land conservation organizations (Troy).

Unfortunately, the vast majority of source water protection areas (SWPAs) are largely, if not completely, unprotected. A SWPA is the area of land that contributes to a public drinking water source. A SWPA can refer to the watershed of a surface water drinking source, such as a reservoir or a river or to a wellhead protection area – the area surrounding a drinking water well from which the well's ground water is drawn.

Figure 2 below shows that half of N.H. community surface water sources have 25 percent or less of their SWPAs (watershed areas) in conservation land and 25 percent of surface water sources have greater than 75 percent of their watershed areas conserved. Eighty-seven percent of community groundwater sources have 25 percent or less of their SWPAs (wellhead protection areas) in conservation land and less than 5 percent of these groundwater sources have greater than 75 percent of their SWPA conserved.

Figure 2
Percentage of land protected in source water protection areas at community water systems

The availability of potential sources of future water supply is also dwindling. In 2009, DES awarded a Local Source Water Protection grant to SPNHF to review and update a statewide analysis DES performed in 1999, published as two volumes titled, *A Guide to Identifying Potentially Favorable Areas to Protect Future Municipal Wells in Stratified Drift Aquifers*. This “favorable gravel well analysis” identifies sand-and-gravel aquifers that hold the potential for high yield water supply wells. SPNHF used up-to-date geographic information system data to overlay on each stratified aquifer a series of prescribed buffer distances based on hydrological features and on development and potential contamination sources, such as highways, pipelines, and railroads. SPNHF analyzed remaining aquifer area outside the buffer areas for potential well yield using U.S. Geological Service data on aquifer characteristics. Their findings were that:

- The total area of all mapped sand-and-gravel aquifers in N.H. is about 805,000 acres, or 14 percent of the state’s land area.
- Only about 85,000 acres, or 11 percent, of that aquifer area is suitable for wells pumping 75 gallons per minute or more (minimum volume for a large community well).
- Only about 20 percent of the 85,000 acres is permanently protected from development.

Adding to the scarcity of available future well sites, many of the remaining high-yield zones in New Hampshire's aquifer basins are in rural or remote areas away from the rapidly urbanizing southeastern quarter of the state, where the need for additional water supply sources is likely to be greatest.

B. WATER SUPPLY LAND PROTECTION GRANT PROGRAM DESIGN

In response to the need demonstrated by the 1998 SPNHF report, the N.H. Legislature created the Water Supply Land Protection (WSLP) Grant Program in 2000, giving municipalities and non-profit water suppliers the opportunity to obtain grants for the purchase of land or conservation easements.

1. Statutory Requirements

RSA 486-A is the statute that establishes the DES WSLP Grant Program. Grants for the purchase of land or conservation easements are available to municipalities and non-profit organizations having water supply as their principal mission. The statute also provides that grants under the program cover up to 25 percent of total project costs, with 75 percent of the cost being matched by the entity requesting the grant. RSA 486-A:12 allows the applicant's 75% match to consist of:

- Cash;
- Transaction expenses, including associated legal and transaction costs;
- Donations of source water protection lands or conservation easements assessed at fair market value and protected in perpetuity; or
- A combination of cash, transaction expenses, and land donations.

Effective July 16, 2009, RSA 486-A:2 was amended to expand the eligibility for the grants to future sources of public drinking water and broaden the definition of grantees to include non-profit land trust organizations.

RSA 486-A:7, II establishes the following eligibility and application requirements for the program:

- The land or conservation easement must be from a willing seller and be within the source water protection area or wellhead protection area of an active, proposed,¹ or future² public drinking water source;
- The source must supply a community or non-transient non-community water system;
- The land or conservation easement must be owned in perpetuity by the grantee;

¹“Proposed source” is defined in Env-Dw 1002.02(n) as “a proposed well or surface water intake for which a community or non-transient non-community water system has received all required approvals from the department.”

²“Future source” is defined in RSA 486-A:2, IV-a. as “(a) Stratified-drift aquifer areas identified by the department as favorable gravel well areas not constrained by existing development; and (b) Other groundwater resources identified by the department as high-yielding aquifer areas not constrained by existing development.” DES has identified and mapped the areas in (a) but not the areas in (b).

- The land must be maintained in perpetuity to protect the drinking water source and no land use or development shall occur that would diminish the quality of the drinking water; and
- The applicant shall provide required stewardship, that is, ongoing surveillance of the land to ensure that the conservation intent is maintained, and submit annual stewardship reports to DES.

RSA 486-A:8 requires that DES establish rules governing the prioritization of applications and include the following factors:

- Distance from and relation to the drinking water source;
- Size of the area proposed for protection relative to size of the source water protection area;
- Natural resource values, including wetlands, habitat protection, and recreational uses;
- Current protection status of the source water protection area; and
- Ability of the applicant to pay for water supply land protection.

Finally, RSA 486-A:11 directs DES to adopt rules to implement the program and further describe requirements for eligibility determination and procedures and requirements for applications, project selection and prioritization, and stewardship.

A copy of RSA 486-A can be found in Appendix A.

2. Eligibility requirements and application ranking and selection

The administrative rules that DES has adopted, Env-Dw 1002, require that a project meet the following criteria in addition to the criteria set forth by the statute described above:

- The land being protected must be undeveloped and free of known and potential contamination sources;
- The project eligibility application must be approved by the local governing body of the municipality applying for the grant, where the applicant is a municipality; and
- The land to be protected must not already be permanently protected and not currently owned by the applicant.

The criteria DES uses to rank and select applications can be found at Env-Dw 1002.12 and are summarized in Table 1 below.

TABLE 1	
PRIORITIZATION FACTORS	
Type of water system (NTNC, community, or municipal)	
Size of water system (people served)	
Number of sources that will be protected	
Size of the area proposed for protection (acres)	
Natural resource values, including wetlands, habitat protection, and recreational uses	
Distance from and relation to the drinking water source	
Length of riparian frontage	

Size of match over 75% provided by applicant
Number of water protection measures being implemented (e.g., educational program; water conservation plan; source water protection area regulations)
Average per capita income and equalized taxable valuation for the municipality where those served by the water supply reside

A complete list of the criteria and the scoring system is in Appendix B.

The administrative rules also set forth the application process for obtaining water supply land protection grants. There is a grant round in the spring and/or the fall depending on the availability of grant funds. The process consists of the following steps:

- Applicant submits a complete project eligibility application by the deadline announced by DES for that grant round.
- DES uses the information provided in these applications to determine which projects are eligible using the criteria in Env-Dw 1002.05. DES then does a preliminary ranking of the projects using the priority ranking system in Env-Dw 1002.12 and notifies applicants within 30 days of the eligibility application deadline whether they are eligible and provides the results of the preliminary ranking.
- DES staff arrange with the applicants to visit the properties that have been conditionally selected to receive a grant.
- Applicants submit a final grant application package to DES by the deadline announced by DES for that grant round, typically two months after the eligibility application deadline.
- DES notifies applicants within 60 days of the final application deadline as to whether their project has been selected to receive a grant award pending Governor and Council (G & C) approval. G & C approval typically takes a minimum of one to two months.

3. Project completion and on-going stewardship

If the project is selected, the applicant must submit the following information for all properties to be protected under the application, including match properties:

- Property survey, prepared in accordance with Env-Dw 1002.16;
- Appraisal, prepared in accordance with Env-Dw 1002.17;
- Title examination, and if necessary, an opinion of title, prepared in accordance with Env-Dw 1002.18; and
- Environmental site assessment, if necessary, prepared in accordance with Env-Dw 1002.15.

In order to provide for water supply protection in perpetuity, either a conservation easement or a deed with restrictions must be recorded (Env-Dw 1002.19(b) describes the minimum restrictions that a deed must contain). Payment is not made until DES has approved these documents and approval of the project has also been obtained by the Attorney General's Office and the Governor and Council. The grantee is required to execute the land transaction and record the deed (Env-Dw

1002.22), adhere to the terms of the conservation easement or deed restrictions (Env-Dw 1002.19), and provide ongoing stewardship of the property (Env-Dw 1002.21).

DES oversees the grantees' stewardship by reviewing annual monitoring reports submitted by the grantee. DES also accompanies some of the grantees when they perform annual site monitoring visits.

4. Revision of administrative rules

Effective May 27, 2011, the administrative rules were revised to incorporate 2009 revisions to RSA 486-A, which expanded the eligibility for the grants to future sources of public drinking water and broadened the definition of grantees to include non-profit land trust organizations.

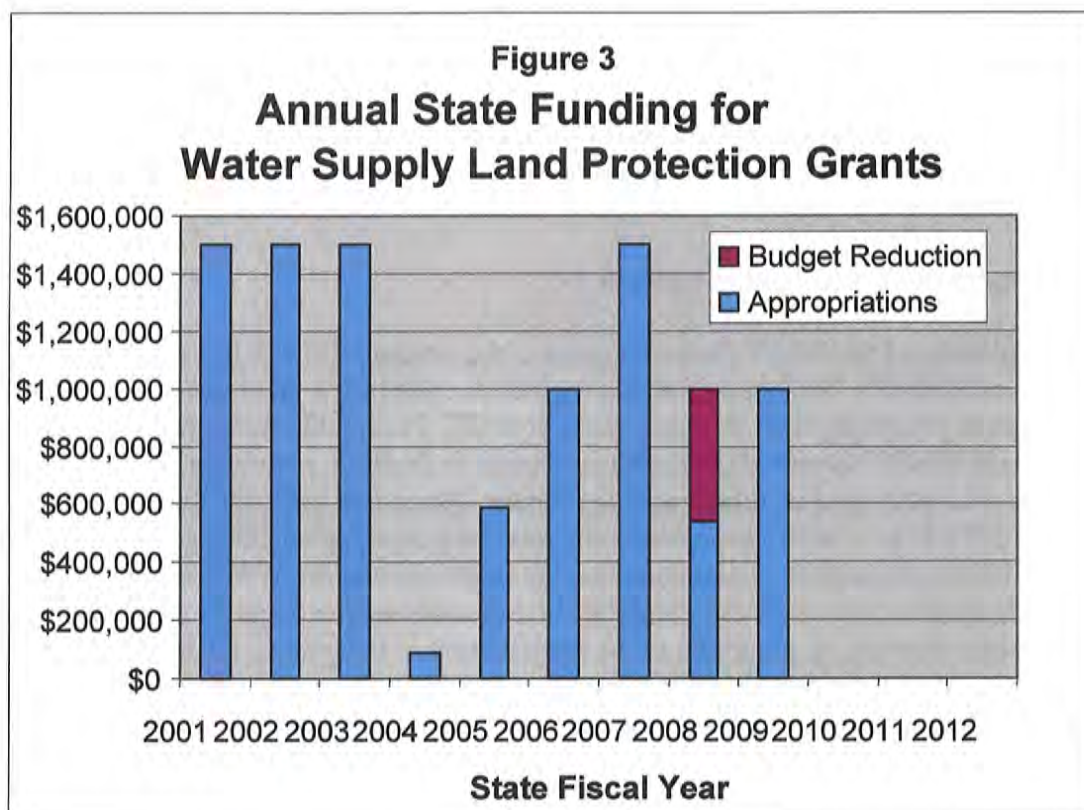

Appendix C contains a complete copy of Env-Dw 1002. More information on the grant process, including applications and a copy of the rules, is available at http://des.nh.gov/organization/divisions/water/dwgb/dwspp/land_acqui/index.htm or by calling Holly Green, Water Supply Land Protection Grant Coordinator, at 271-3114.

C. HISTORY OF THE WSLP GRANT PROGRAM

1. Funding

The WSLP Grant Program staff person is funded through a set-aside in the Drinking Water State Revolving Fund, which DES receives from the U.S. EPA pursuant to the Federal Safe Drinking Water Act. This makes it possible for all state funding provided for the WSLP Grant Program to be used solely for grants.

As indicated in Figure 3 below, the Legislature appropriated \$1.5 million per year in the first few years of the program, but since then annual appropriations have ranged from zero to \$1.5 million. In 2007, the legislature appropriated \$1 million per year for Fiscal Years (FY) 2008 and 2009. However, budgetary cutbacks reduced the FY 2008 funds to \$542,750 and the FY 2009 funds to zero. No funds were appropriated for FY 2010 and FY 2011 and, to date, no funds have been appropriated for FY 2012. The average appropriation over the life of the program has been \$768,521 per year.

In FY 2011, the program received \$3 million from the N.H. Department of Transportation (DOT) mitigation fund associated with the widening of Interstate 93 between the Massachusetts border in Salem and the I-93/I-293 interchange in Manchester. Under a Memorandum of Understanding (MOU) between DES and DOT, the funds are limited to the protection of water supply lands in the communities (Salem, Windham, Derry, Londonderry and Manchester) impacted by the I-93 project and land in the watershed of Lake Massabesic, which provides drinking water to the City of Manchester. The \$3 million of funding is available through June 30, 2016. A copy the MOU and a map of the areas eligible for these grants are in Appendix J.

2. Grant applications

Prior to 2009, when state-wide grant funding was zeroed out, the number of applications had steadily increased. In FY 2000, four eligibility and four final applications were received. In FY 2008, 13 eligibility and 10 final applications were received. The geographic distribution of applications also became more widely dispersed throughout the state. In 2000 through 2005, applications were received only from municipalities in the southern region of the State. After 2005, applications from other regions were on the increase.

From 2003 through 2008, grant requests not only exceeded the funds available each grant round, but the disparity between grant requests and the amount of funding available continued to increase. Even in years in which no state-wide grant funding has been available, namely 2009 through the present, there have been frequent inquiries about the grants from municipalities, public

water systems, and land conservation organizations with specific projects to protect critical water supply land.

In Fall 2011, a grant round was held to award grant funding related to the I-93 widening as described in Section C.1. All of the final applications received were awarded grants and are described in Section D. 3. Another grant round was announced in March 2012.

3. Collaboration with other organizations

From the beginning of the WSLP Grant Program to the present, SPNHF has been an important partner. It was SPNHF's 1998 study that highlighted the need for a grant program to assist municipalities in protecting their drinking water sources. From 2000 through 2004, DES contracted with SPNHF to provide valuable assistance in drafting, reviewing, and negotiating conservation easement deed language with applicants. Since that time, DES has continued to consult with SPNHF on conservation easement deed language and on cutting-edge conservation issues. SPNHF has revised its model conservation easement and the WSLP Grant Program has used this as it updates its own model conservation easement with a focus on drinking water protection. Most recently, as described in the Introduction to this report, DES contracted with SPNHF to conduct a study that identifies the extent to which the availability of potential high-yielding well sites in New Hampshire's sand-and-gravel aquifers is shrinking due to land development.

Many organizations have been and continue to be important partners by assisting municipalities and/or contributing to municipalities' required 75% match. These partners include SPNHF, the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS) through its Farm and Ranch Protection Program and Wetlands Reserve Program, the Nature Conservancy, the Great Bay Resource Protection Partnership, the federal Coastal and Estuarine Land Conservation Program, the N.H. Fish and Game Department's Landowner Incentive Program, the NH Land and Community Heritage Investment Program (LCHIP), TPL, and a number of regional land trusts. There are also DES programs which have either provided match funding in the past or have the potential to provide funding in the future. These DES programs include the Aquatic Resource Mitigation (ARM) Fund and the Drinking Water State Revolving Loan Fund.

At the DES Drinking Water Source Protection Workshop in May 2011, the WSLP Grant Program collaborated with NRCS to present a workshop on land conservation funding opportunities. NRCS provided a speaker who gave a presentation on the NRCS Wetlands Reserve, Farmland Protection, and Grasslands Protection grant programs. Since 2009, DES has been a leading participant in the Salmon Falls Watershed Collaborative, a project which has led to substantial commitments of resources from NRCS to prepare forest management plans for landowners in the Salmon Falls River and Merrimack River watersheds.

The WSLP Grant Program is also a participant in a SPNHF initiative to develop a Merrimack Valley Strategic Conservation Plan, which would identify priority areas for land protection in the lower Merrimack River watershed. Development of this plan is a collaborative effort of numerous federal and state agencies, statewide and local non-profit land trust organizations, and regional planning commissions in N.H. and Massachusetts. A 2009 USFS report ranked the Merrimack

watershed number one in the United States in terms of total acreage of private forest projected to experience increased housing density and number four among watersheds projected to experience the greatest deterioration in water quality as a result of increases in housing density on private forest lands.¹² The Merrimack River is used as a water supply source by Pennichuck Water Works and is considered a likely future source by the City of Concord. A number of municipal systems withdraw water from wells located very close to the river, and Manchester Water Works is developing plans to do so as well.

D. PROJECTS FUNDED TO DATE

1. Projects completed prior to June 2012

Projects completed prior to June 2012 are listed in Appendix D. Over the life of the program, grant awards have averaged \$177,826 per project and the SWPA land protected with each project has averaged 136 acres. These projects are also described in more detail in the first, second, and third WSLP Grant Program reports issued in 2003, 2005, 2008, and 2010 respectively.

2. Projects completed since the previous report

Due to lack of funding, no grant projects have been completed since the date of the previous report (June 2010) through May 2012.

3. Projects pending as of May 31, 2012

The following projects received grant awards in 2011, made possible by the DOT I-93 mitigation fund, but have not yet been approved by G & C. Once an applicant submits an appraisal, draft conservation easement, and a signed grant agreement between DES and the applicant, DES will submit a request for authorization to G & C. The pending projects are listed below in alphabetical order by municipality.

AUBURN (Mason property) – This project will protect 34 acres in the source water protection area of Lake Massabesic, Manchester's drinking water supply, which serves a population of 133,000.

DERRY (South Range Realty Trust property) – This project will protect 63.5 acres within the wellhead protection area of a community well (Willowbend CWS). This land is 255 feet from the well.

HOOKSETT (Reading Cooperative Bank properties) – Bear Paw Regional Greenways submitted the application for this project, which will protect 172 acres in the source water protection area of Lake Massabesic, Manchester's drinking water supply, serving a population of 133,000

WINDHAM (Forty Acres Development Company property) – This project will protect 33 acres within the wellhead protection areas for 8 community wells. This land is 504 feet from the nearest well.

4. Other program accomplishments

Since June 2010, the program has executed a memorandum of understanding with the DOT for funding related to the widening of I-93 as described in Section C.1 and held a Fall 2011 and a Spring 2012 grant round (described in Section C.3). The program has also established a program tracking database. The database tracks certain activities (e.g., stewardship monitoring) and other measures related to land conservation conducted under this program. Specifically, the database does the following:

- ✓ Tracks approvals and receipt of documents related to the WSLP grants and conservation projects.
- ✓ Identifies missing or overdue documents concerning certain activities, such as annual land stewardship monitoring.
- ✓ Generates key reports regarding funding, expenditures, land area protected, and other key measures.
- ✓ Links completed WSLP conservation projects to NH GRANIT (a database used by geographic information systems).

E. PROGRAM OUTREACH

The purpose of the program's outreach efforts has been to maximize the program's effectiveness by encouraging the submission of applications for geographically diverse, high-quality projects.

Outreach consists of publicizing the program; providing potential applicants with information about the benefits of permanent protection of critical water supply lands, including the avoidance of remediation costs; and assisting prospective applicants with information regarding eligibility, scoring, and supplemental funding sources. Specifically, this is being done by:

- Posting information and announcements of grant availability on the DES web page;
- When grant funds are available, distributing information packets to water system operators when DES staff perform sanitary surveys (on-site inspections of public water systems);
- Publishing information and announcements in DES Source Water Protection Program quarterly newsletters (distributed to water suppliers, conservation commissions, and planning boards); and
- Giving presentations and providing written materials at conferences and workshops attended by water system operators, members of the conservation community, and local officials.
- Electronic mailings to community drinking water supply owners and operators, town administrators and city managers, non-profit land trust organizations, and the NH Association of Conservation Commissions.

For the I-93 grants, the WSLP Grant Program Coordinator also:

- For each grant round, mailed a notice and information to all of the community water system owners and operators, town administrators and city managers, non-profit land trust organizations, and conservation commissions in the eligible geographic area; and
- Offered to meet with each of the nine conservation commissions in the eligible area and met with the seven conservation commissions that agreed to listen to a presentation about the grants.

Extensive technical assistance is provided to applicants during the pre-application and application process, including printing maps upon request.

F. FUTURE GOAL

The program's goal is to continue to partner with organizations, such as SPNHF, NRCS, regional planning commissions, and local land trusts, to work with municipalities to develop strategic land conservation plans that include critical water supply lands, including lands that could serve as future water supply as identified by Favorable Gravel Well Analysis.

As described in Section C.3., the WSLP Grant Program is continuing to pursue collaboration with SPNHF and others to even more effectively assist municipalities in conserving land to protect drinking water. Not only will such partnering be more efficient, but it will allow DES to ensure that critical water supply lands are identified as a priority in municipal strategic land conservation plans.

G. CONCLUSION

Land conservation continues to be an extremely effective way to protect drinking water quality. The WSLP Grant Program has funded the acquisition of 5,028 acres of critical water supply land since its inception in June of 2000. The program has assisted and collaborated with municipalities, water suppliers, federal and state agencies, land trusts, and other conservation organizations as part of this protection effort.

Building on this success, DES has pursued ways to improve the program, such as revising the WSLP Grant Program administrative rules in 2009 to emphasize the most critical water supply lands, particularly those close to water supply sources and their tributaries. DES will also seek to increase collaboration between water suppliers and municipal staff, to explore potential roles for regional planning commissions, to improve stewardship monitoring of protected lands, to increase the geographic distribution of projects, and to incorporate into the program the latest information regarding land conservation and water quality protection. As more is learned about what works, DES will continue to modify and improve its program, its requirements, and its outreach to maximize the drinking water quality benefits of the state funds invested in this program.

Ensuring safe and adequate drinking water supplies requires maintaining the quality and availability of present and future water supply sources, because in the long run it is less expensive and more protective of public health to prevent contamination than it is to treat water to meet health standards, and it is less expensive to use existing sources than it is to develop new ones. New contaminants of concern continue to emerge, potentially requiring more costly treatment of source waters if they have not been adequately protected.

Municipalities and water suppliers have crucial roles in managing activities that affect source water quality and availability. DES's primary role is to provide technical and financial assistance and to enforce state regulations that serve to protect the state's sources of drinking water. Effective protection relies on the combined efforts of the state, water suppliers, municipalities, businesses, institutions, and individuals whose activities have the potential to affect source water quality and availability.
